

ALOE STRIATA CORAL ALOE

Coral Aloe is a plump, luscious-looking garden accent. The thick, sage-green leaves are arranged in a short, full rosette. The rosette hugs the ground instead of forming a trunk like many aloe species. Coral Aloe has smooth, spineless leaf margins, which are edged with a wide pink-orange stripe and attractive parallel orange stripes. Tall, flat-topped spikes of bright coral-orange flowers provide nectar for hummingbirds in the fall months. *Aloe striata* prefers some afternoon shade in the low deserts, and requires well-drained soil. Native to South Africa.

AT A GLANCE SUMMARY

| | |
|---------------|----------------------------|
| SIZE (H X W) | 2-3 feet x 1-2 feet |
| FLOWER COLOR | Coral - Orange |
| FLOWER SEASON | Late Winter |
| EXPOSURE | Part Shade |
| WATER | Low to Moderate |
| GROWTH RATE | Moderate |
| HARDINESS | 25° F, USDA Zone 9 |
| PRUNING | Remove spent flower stalks |
